

# Winter Ulcer Disease

Photo: Brit Tørud

# Aetiology

- ***Moritella viscosa***
  - Previously classified as *Vibrio viscosus*
  - Most closely related to *Moritella marina* (prev. *Vibrio marinus*)
- ***Aliivibrio (Vibrio) wodanis***
  - Named after the Norse god Wodan (as in Wednesday) = Odin (as in onsdag)
  - Most closely related to *V. logei*
    - Norse god Loge = Loke, Odin's blood brother
  - Heterogeneous both genetic and phylogenetic

# Phylogenetic tree

Lunder et al. 2000  
Benediktsdottir et al 2000

## Antigen profiles of the fish pathogen *Moritella viscosa* and protection in fish

## No adequate treatment

- **Antibiotics are not sustainable**
- **Almost all fish in Norway are vaccinated against *M. viscosa***
  - A bath challenge model for *M. viscosa* is established
  - Good protection in experimental studies
  - Poor protection in real life
- ***Aliivibrio (Vibrio) wodanis***
  - The bacteria is detected in most salmons with winter ulcers, but the significance is unknown

Ulcers open for additional infections, but normally only *M. viscosa* and *A. wodanis* are detected

# Project:

## The importance of bacterial interactions for winter ulcer and the potential use in control of fish diseases

Project manager Prof. Henning Sørum  
Post-doc Renate Johansen, Oslo / Copenhagen  
Prof. Lone Gram, Copenhagen  
Post-doc Anette Bauer Ellingsen, Oslo  
PhD-student Christian Karlsen, Tromsø  
Prof. Nils-Peder Willassen, Tromsø  
Helene Mikkelsen, Tromsø  
Bereket Tesfamichael, Oslo

## Lunder et al. 1995

Table 2. Bacteria isolated from skin ulcers and/or kidneys in different individuals of *Salmo salar* from 8 different fish farms with winter ulcer

Bacteria	No. of fish farms	Fish with skin ulcers (n = 102)		Fish without skin ulcers (n = 67)
		Ulcers No. (%)	Kidney No. (%)	Kidney No. (%)
<i>Vibrio</i> sp. 1 <sup>a</sup> <b><i>Moritella viscosa</i></b>	1	7 (7)	13 (13)	3 (4)
<i>Vibrio</i> sp. 2 <sup>b</sup> <b><i>Vibrio wodanis</i></b>	2	34 (33)	35 (34)	6 (9)
Both <i>Vibrio</i> sp. 1 and <i>Vibrio</i> sp. 2 <sup>c</sup>	5	60 (59)	29 (28)	0
Bacteria other than <i>Vibrio</i> sp. 1 and <i>Vibrio</i> sp. 2	0	0	0	4 (6)
No bacteria	0	1 (1)	25 (25)	54 (81)

<sup>a</sup>Isolated in pure culture or mixed with bacteria other than *Vibrio* sp. 2  
<sup>b</sup>Isolated in pure culture or mixed with bacteria other than *Vibrio* sp. 1  
<sup>c</sup>Both vibrios present, sometimes mixed with other bacteria

## Ulcers mainly on the side of the fish, mechanical factor?

Photo: Brit Tørud

# Pathology

- **Little is known of the pathogenesis**
- **Ulcers**
- **Septicaemia**
  - Signs of circulatory failure like fluid in the abdominal cavity
  - Petechial haemorrhages on intestinal organs etc.
  - Detection of bacteria both in kidney and ulcers
- **Possible to find bacterial septicaemia in fish with no ulcers, but most of the diseased fish has ulcers**

Immunohistochemistry of  
Atlantic salmon (50 g)  
challenged with *M.*  
*viscosa*

# Cell culture infection with *M. viscosa* (CHSE cells)

- a. 2h
- b. 4h
- c. 8h
- d. 14h

Norwegian School of Veterinary Science Actin staining of CHSE cytoskeleton  
*M. viscosa* infection

- a. Control
- b. 1h
- c. 5h
- d. 7h

CHSE cells 30 min after  
addition of culture  
supernatant of *M. viscosa*

Control

Graphs by Temperature and NaCl (%)

Toxins, secretion systems and colonization factors found in *M. viscosa* (Hege smith Tunsjø , MP)

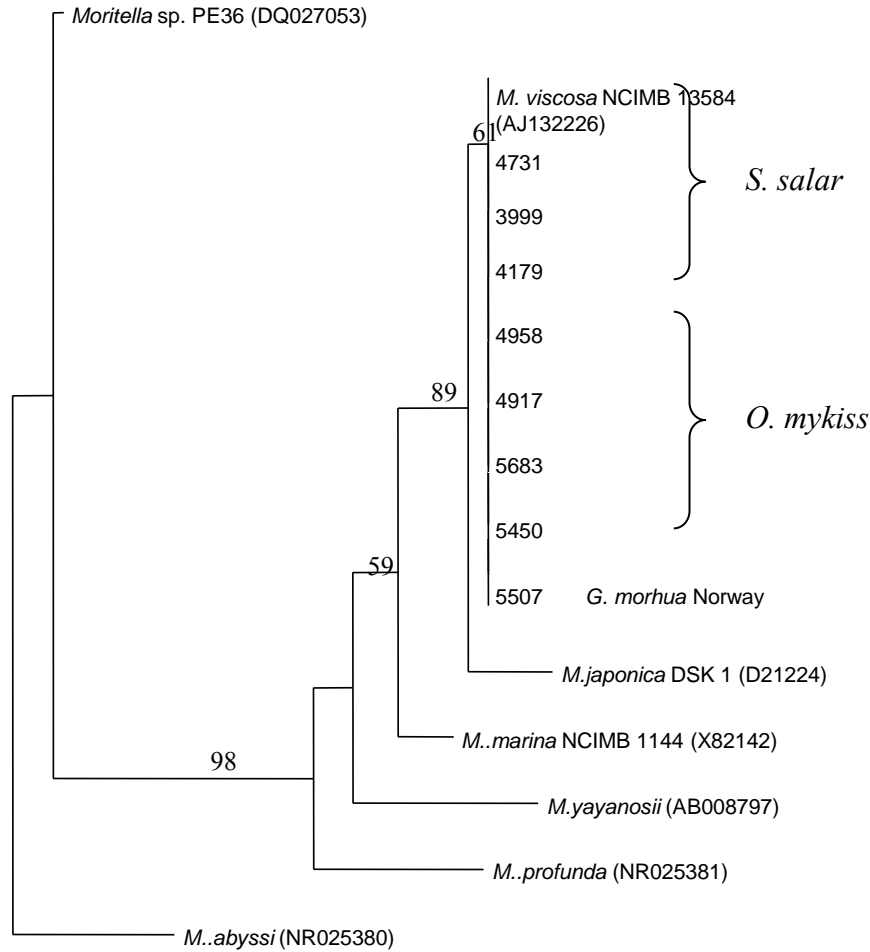

<i>M. viscosa</i> T <sup>88/478</sup> (NVI/ScanVacc)	
<b>Exotoxins and degrading enzymes</b>	<b>Hemolysins</b> <b>RTX</b> <b>Proteases</b> <b>Phospholipase</b> <b>Lipases</b> <b>CNF</b> Insecticidal toxin
<b>Secretion systems</b>	Type I Type II Type VI
<b>Colonization factors</b>	<b>Polar flagella</b> <b>Lateral flagella</b> <b>Type IV pili</b>

Atlantic salmon bath challenged with *Moritella viscosa* – Pathogen invasion and host response

M. Løvoll<sup>a,\*</sup>, C.R. Wiik-Nielsen<sup>a</sup>, H.S. Tunsjø<sup>b</sup>, D. Colquhoun<sup>a</sup>, T. Lunder<sup>c</sup>, H. Sørum<sup>b</sup>, S. Grove<sup>a</sup>

- PCR analysis suggested gills as the port of entry as DNA from *M. viscosa* was consistently detected from an early time point compared to muscle, skin and intestine samples.

Grove S., Wiik-Nielsen C., Lunder T., Tunsjø Smith H., Reitan L.J., Martinussen A., Sørgaard M., Tandstad M., Olsen A.B. and Colquhoun D.J. (2010) Previously unrecognised division within *Moritella viscosa* isolated from fish farmed in the North Atlantic. *Diseases of Aquatic Organisms*. 93: 51-61.

## Sanger sequencing of *Moritella viscosa* and *Vibrio wodanis*

- Both isolates from the same kidney of one salmon that was diseased in an outbreak of Winter ulcer in 2006.
- Finalized 2012?

# Keratocytes are cleaning and repairing the skin

- [Karlsen et al 2012 Veterinary Microbiology Volume 154, Issues 3–4, 27 January 2012, Pages 353–362](#)

## *Moritella viscosa* is excreting an immunogenic product

# Scanning electron microscope of keratocytes

## Port of infection

- For bacteria infecting fish little is known about the port(s) of infection
- Assuming that gills and or intestine are important
- For Winter ulcer a skin port should be expected.
- Most ulcers along the side line of the fish
- Is the side line a never discovered port of infection?
- Other unattended ports like mucosa in the olfactory organ?

# Port of infection, *Moritella viscosa*

Karlsen et al 2012

# Co-cultivation of *M. viscosa* and *V. wodanis*

<i>In vivo</i>	<i>In vitro</i>
<i>M. viscosa</i>	<i>V. wodanis</i> (0.2, 0.5, 1.0)
<i>V. wodanis</i>	<i>M. viscosa</i> (0.2, 0.5, 1.0)
<i>M. viscosa</i> + <i>V. wodanis</i>	<i>V. wodanis</i> / <i>M. Viscosa</i> (0.5, 1.0)
<i>M. viscosa</i> / <i>V. wodanis</i>	<i>Vw</i> + <i>Mv</i> supernatant (~0.2)
	<i>Mv</i> + <i>Vw</i> supernatant (~0.2)

## Coordinated Bacterial Virulence: Relevance in Winter ulcer.

- Funding 6,5 mill NOK for 3 years by FHF and NFR Aquaculture Program
- Objectives – Address several key virulence factors genome sequencing
- Knock-out mutations of putative virulence genes and testing in model systems and in the natural host
- Test the activity of the immune genes of the host as a response of the virulence factors
- High-throughput testing of mutants in cell cultures and bio-assays

## Partners

- *National partners:*
- Associate Professor Hanne Winther-Larsen, UiOslo
- Senior Research Scientist Anne Tøndervik, SINTEF, Tr. Heim
- Professor Nils Peder Willassen, UiTromsø
- Professor Henning Sørum, NVH
- *International partners:*
- Professor Debra Milton, UiUmeå/Southern Res Inst, Alabama
- Professor Matthew Waldor, Harvard Medical School, Boston
- Senior Research Monica Hagedorn, Bern.Noct Inst, Hamburg
- Senior Research Sun Nyunt Whai, UiUmeå

## To the funding bodies:

- Thank you for the trust, we will do our very best to reduce the winter ulcer losses by the knowledge gained previously combined with the novel approaches of  
**COBACVIR!**
-
