The carbon footprint of 1 kg salmon at farm gate and 1 kg of feed:

1 kg feed =

2.3

kg CO_2e

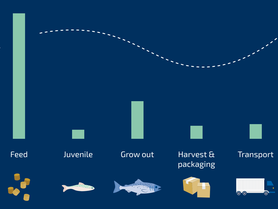
1 kg fish =

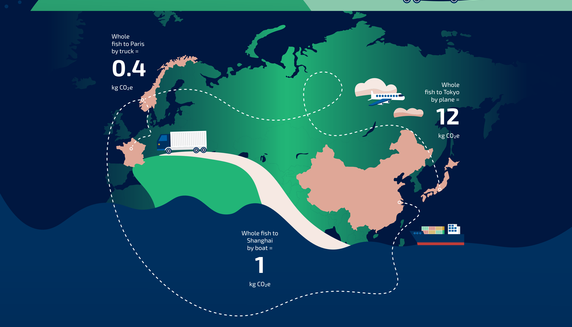
3.8

kg CO_2e

Based on mass allocation method

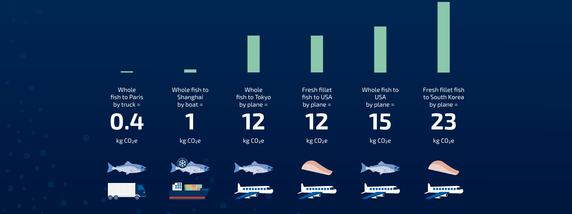
The share of the different stages to the total carbon footprint of salmon delivered in Paris:



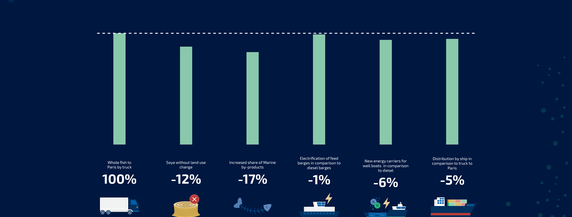


Greenhouse gas emissions from the transportation stage of the supply chain:

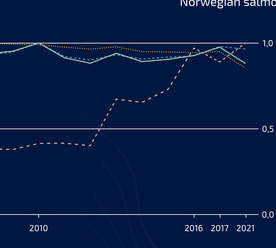
(All numbers calculated in kg CO_2equivalent / kg edible product at wholesaler)



Percentage reduction compared to fresh gutted fish transported to Paris by truck:



Development of the climate footprint for Norwegian salmon from 2008 to 2021:

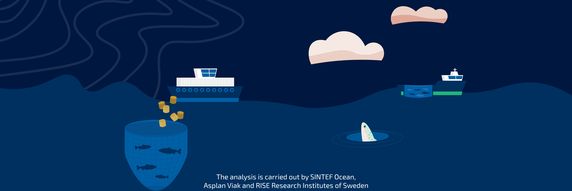


Feed
Trend
eFCR
Other costs

From 2017 to 2021, reduction in climate footprint =

10%

due to reduction in footprint of feed



The analysis is carried out by SINTEF Ocean, Asplan Viak and RISE Research Institutes of Sweden and financed by FHF. Project number: 901718.
